Five Star® Grout is a unique product that is now available from a new UK supplier...

Five Star® Grout was developed by Five Star Products, Inc. over 50 years ago. It was patented partly because it included PLA (Permanent Life Aggregate), a unique additive that ensures consistent positive expansion across a wide temperature range and at various water contents. Metallic powders, for instance, are common expansive additives also used in the market, yet these powders do not provide the same level of performance across a range of environmental conditions. Predictable grout expansion is vital to ensuring optimal effective bearing area (EBA) of a grout installation. If expansion is unpredictable, EBA typically decreases, and a grout placement becomes susceptible to numerous problems. Because of PLA, Five Star developed the original test method now known as ASTM C 827. This method has since become the industry standard for measuring controlled expansion in the plastic state. Five Star has helped shape material requirements in the precision grouting industry for decades.

In 2022, FSP began supplying PLA enhanced Five Star® Grout, among other products, to the United Kingdom market from a UK manufacturing facility. Five Star's products are now exclusively offered through our partner in the region, Precon Products, Ltd of Woolpit, UK. In the process, we have also worked to further improve the flow and workability properties of the Five Star® Grout being produced in the UK. Five Star Products, Inc. is the only manufacture of cementitious grout with operations in the UK offering PLA enhanced products, and Precon Products is the sole distributor through which any Five Star materials are being made available in the UK.

Product range available through Precon Products:

Five Star® Grout, Five Star® Fluid Grout 100, Five Star® Repair Concrete, Five Star® Cementitious Underwater High Strength Grout, Five Star® High Strength 130 Grout, Five Star Structural Concrete® V/O, Five Star Structural Concrete® Underwater Hand Pack
